9 Quality Competition

Chapter 6 introduces a simple model of quality competition. Here, we will revisit some features of the model. Use the “model on page” to answer the following questions.

- a) Identify equations that represent assumptions! State each assumption as an English sentence!
- b) Which equations represent the DD and EE curves?
- c) What is the economic intuition of each curve?
- d) Draw the x, q -diagram discussed in class.
 - i) Why are the two curves shaped the way they are?
 - ii) Which point represents the market equilibrium without regulation?
 - iii) Which point represents the welfare optimum?
- e) How can the government implement the optimum?
- f) Now, assume an open economy with many small countries:
 - i) Under which assumption will governments still implement the welfare optimum if there is no supra-national regulation?
 - ii) Why is this assumption unlikely to be true?
 - iii) Which outcome will prevail instead of the welfare optimum?
